

Gym Management System

Database Design & Analytics Project — Scenario Document

SCENARIO

A database for a Gym Management System is used to manage members, gym branches, subscriptions, and workout sessions.

The gym company has many branches; each branch has a unique Gym ID, location, gym type, and available facilities.

The system stores information about members including a unique User ID, first name, last name, age, gender, birthdate, sign-up date, location, and subscription plan.

Each member subscribes to one subscription plan. Each subscription plan is identified by a unique Subscription Plan and includes the monthly price and available features.

A member can visit any gym branch and perform different workout sessions.

The system records each workout session including the Gym ID, User ID, check-in time, check-out time, workout type, and calories burned.

The system allows the gym management to monitor members' activities, analyze workout behavior, evaluate branch performance, and generate reports for better decision-making.
